Continuation of 11, does NOT place the application in condition for allowance because:

RESPONSE TO ARGUMENTS

Applicant's arguments filed 21 July 2010 have been fully considered but they are not persuasive.

Applicant notes that Meierhoefre and Itoh lack a polyolefin-polycycloolefin blend in the claimed ratios of the intermediate layer of the container. Examiner finds that Ding fails to remedy this deficiency, since Ding does not provide any teaching or suggestion that the barrier properties of a plastic ampoule having a three layered structure could be improved by using a layer of a polyolefin-polycycloolefin blend.

Applicant reasons that Ding instead fabricates rigid, semi-rigid or flexible medical devices regardless of required mechanical properties. Applicant notes that Ding discloses rigid parts (such as Y-sites, filter housings in FIG. 1), semi-rigid parts (such as drip chamber 20 in FIG. 1) and flexible parts (such as medical container 12 in FIG. 1) which may be fabricated from COCs as a polyolefin-polycycloolefin blend (Col. 6, lines 30-63).

Here, Applicant finds that Ding is nonanalogous art since these integral structures lack multiple layers. Applicant reasons that one of ordinary skill in the art looking to provide a suitable multi-layered structure for a plastic ampoule would not considered Ding to modify the container of Meirerhoefer and thos.

Examiner finds motivation to modify that Meleithoefer and Itoh in view of Ding, since Meleithoefer calls for a polymer adapted for solvent bonding. That is, COCs can be bonded or adhered by adding a solvent, joining the partially dissolved COC layer to other materials, when then allowing the solvent to evaporate. This avoids water-based adhesives, and keeps the overall water content low in the final article. Therefore Examiner maintains the rejection over Meleithoeffer this and Ding.
